

Radar Target Simulator, Direct Reading, 76.5 GHz

Description:

Model STR-773-12-D1 is a radar doppler simulator that operates at 76.5 GHz with a bandwidth of ± 250 MHz and a WR-12 waveguide input/output. The simulator utilizes a single-sideband-modulator to modulate the incoming signal transmitted by the radar under test and sends back either a higher or lower band signal through a diplexer. The frequency-shifted signal is transmitted back to the radar under test as a Doppler signal. Target characteristics are adjusted by changing the I and Q channel frequency and phase. The routing attenuation is adjusted by the direct reading attenuator.

Features:

- Single Sideband Output
- Simulated Target Speed and Size Adjustable
- Simulated Target Moving Direction Switchable
- Instrumentation Grade

Applications:

- Doppler Target Simulations
- Radar System Testing
